

Magic Don

When children for the first time see a plane fly, or see a glass of water change color as a flavor is added, they see it as something magical. Adults may not know specifics but they know it's science. Children don't have the accumulated knowledge that adds up to knowing that there is a logical explanation. They are amazed and in awe. It's the same response when they see a magic trick.

In *Magic is Science ...Unexplained*, Magic Don uses magic tricks and science experiments to amaze and amuse children, explain the laws and principles of science, and show them how exciting and fun science can be.

The show features a number of different sciences: Physics, Chemistry, Anatomy, Physiology, Psychology, Earth Science and Biology. Magic tricks are even used to explain the science.

“Would you like to know the secret of how we do that ?” asks Magic Don; after he does what seems to be a magic trick. The idea of learning a secret captures the attention of children and adults alike.

Magic Don has been performing and teaching children for 40 years and with 350+ shows a year he's the number one family entertainer in the Midwest.

Did the water evaporate?

Science was an early love of Magic Don's and he wants to pass it on to new generations. At

the end of the show he explains that magicians have to have a good knowledge of many different sciences. Then he explains, “the next time you see a magic trick, you'll know that is why magic is science unexplained.”
